HEPATITIS C

Hepatitis C virus (HCV) can cause long-term health problems, including liver damage, cirrhosis, liver cancer, liver failure, and even death.

HCV is passed through blood, often through sharing syringes or other equipment used to inject drugs. HCV can survive in a used syringe for over 60 days.

About 11,000 San Francisco residents are living with HCV, many of whom are unaware of their status.

HCV can now be cured with medications that work in just 8-12 weeks. These medications are easy to take, have almost no side effects, and are free with Medi-Cal or other insurances.

END HEP C SF

End Hep C SF is a collective impact initiative that aims to eliminate hepatitis C in San Francisco. We achieve this through advocacy, prevention, education, testing, treatment, and linkage to reduce morbidity, mortality, and stigma related to hepatitis C.

For more information about hepatitis C testing or linkage to treatment,
