

How is Hep C Transmitted?

Hep C is transmitted through blood-to-blood contact

Sharing syringes and injection supplies like cookers and cottons is the most common way hep C is transmitted

Hep C can also be transmitted by:

- sharing glass pipes, straws, and other smoking or snorting supplies

- from birth parent to child

- unsterile piercing and tattooing

- sometimes through sex

If you have a higher risk of getting hep C, you should get tested every year

Know Hep C

Have you been **tested** for hepatitis C?

About half of all people living with hep C **don't know they have it**

CDC recommends that **every adult get tested at least once**

People at **higher risk of hep C** should **get tested once a year**

Ask your doctor about getting tested today!

What is Hep C?

Hepatitis C is a virus that can cause liver damage or liver cancer

Many people with hep C have no symptoms for years

Getting tested is the only way to know for sure if you have hep C

There is no vaccine that prevents hep C but there is a cure

What do my Test Results Mean?

Hep C antibody (Ab) test:

-  Tells you if you have ever been **exposed** to hep C
-  **Ab negative:** You have never been exposed to hep C. No other test is needed.
-  **Ab positive:** You were exposed to hep C at some point. You will need an RNA test to know if you currently have hep C or not.

Hep C RNA test:

-  Tells you if you have an **active hep C infection**
-  **RNA negative:** You don't have hep C and no other steps are needed.
-  **RNA positive:** You have hep C and will need to take medication to cure it. See next page for information about hep C treatment.
